

# SkyScan Ti -PLUS 2 Heat Index Weather Station

The **SkyScan Ti -PLUS 2 Weather Station** is a multi-functional compact weather instrument that displays temperature, humidity, heat index and provides a forecast based on the data collected.

Four different levels of heat stroke alerts are displayed along with an audible warning. Other features include; clock, countdown timer, alarm date and low battery indicator.

The Ti-Plus has just recently been discontinued and has been replaced with the All NEW Ti-Plus2.

Our team of engineers have been working on the redesign of its features, housing, and overall design. The new housing is much more water resistant than the previous version. This allows the internal components to provide a more accurate reading of temperature, humidity and heat index.

## Recent technical improvements:

- upgrades to the temperature and humidity sensors for improved accuracy. The sensors are the same ones we use in our professional weather-monitoring systems costing several thousand dollars.
- New software development has allowed us to add **weather forecasting** capability to this product which was not possible on the older Ti-Plus.
- The Ti-Plus 2 monitors changes to barometric pressures, humidity and temperature in a way that it can also predict incoming rainstorms.

## NEW FEATURES INCLUDE:

- **New feature:** back lit LCD display clearly visible in low-light conditions.
- **New** keypad lock function prevents the unit from being tampered with by accident while in a bag, pocket or drawer. The keypad can be locked and silent when not in use.
- **New** low-battery indicator
- The new Ti-Plus 2 also employs a maximum temperature, humidity and heat index memory that stores the most extreme conditions for historical reference.
